

Ana Ghindariu

Senior Software Engineer | .NET & Azure | AI-Augmented Development

📍 Cluj-Napoca, Romania ✉️ ana.ghindariu@gmail.com 💼 [LinkedIn](#)

PROFESSIONAL SUMMARY

Senior .NET engineer with 10+ years turning early-stage and legacy backends into production-ready systems on Azure and AWS, with reliable integrations, clean data and sensible cloud bills. My latest engagement added a team-wide move to guarded, spec-driven, AI-assisted delivery that ships faster without lowering the bar, alongside team organization and cross-team coordination.

SKILLS & EXPERTISE

Cloud & DevOps

- Terraform
- Azure Container Apps
- Azure Functions
- Azure Service Bus
- AWS
- Docker
- CI/CD
- Git

Practices & Methodologies

- Microservices
- CQRS
- Event-Driven Architecture
- System Architecture
- Agile/Scrum
- Unit Testing
- Technical Leadership

AI & Intelligent Systems

- AI-Assisted Development
- Claude Code
- Prompt Engineering
- AI Governance
- Agentic AI Workflows

Programming & Frameworks

- .NET 10
- ASP.NET Core
- C#
- .NET Core
- .NET Framework
- Python
- MediatR
- FluentValidation
- Dapr

Databases & Data

- Cosmos DB
- Redis
- PostgreSQL
- Elasticsearch
- SQL Server
- SQLite
- ETL Pipelines

WORK EXPERIENCE

Senior Software Engineer (Contract), Discount Ninja (Jan 2026 – Sep 2026)

TECH STACK

.NET 10

ASP.NET Core

Azure Functions

Azure Container Apps

KEDA

Dapr

MediatR

Cosmos DB

Azure Service Bus

Redis

Terraform

Docker

Azure DevOps

xUnit

Playwright

Shopify Admin API

Claude Code (subagents, skills, slash commands, hooks, MCP)

Spec Kit

RESPONSIBILITIES

AI-Augmented Delivery

- ▶ Led the team's move to AI-assisted delivery in Claude Code: spec-driven development (Spec Kit), an independent reviewer agent, and review → fix → re-review loops in isolated git worktrees
- ▶ Built the tooling that kept it safe and fast: custom skills and slash commands for recurring workflows, hooks that block unsafe actions such as pushes to main, and CLAUDE.md rules that codify the architecture

Architecture & Backend

- ▶ Owned core backend features from start to finish: the price-reduction batch pipeline on Azure Functions, and the integration with the company's shared commerce platform (webhook-driven, queue-based install and uninstall lifecycle)
- ▶ Raised the system's engineering maturity across data integrity, integration reliability and code structure: idempotent, recoverable workflows over multi-tenant Cosmos DB, zero-downtime schema evolution, resilient Shopify GraphQL batch writes, and explicit dependency-injection registration per host
- ▶ Brought production-readiness discipline: root-caused flaky end-to-end suites and silent error reporting, isolated tenant data from the legacy app, and defined the branch-to-environment CI/CD strategy
- ▶ Documented the system as the source of truth for both engineers and AI agents: architecture docs (service map, infrastructure inventory, Shopify pipelines, code patterns) and 250+ engineering notes covering decisions, investigations and runbooks

Cloud Cost & Reliability

- ▶ Traced rising non-production spend to container apps pinned at one replica after deploys, then cut projected spend by 57–69% through right-sizing, KEDA scale-to-zero and a liveness-probe redesign that ended restart loops

OVERVIEW

Production SaaS for Shopify merchants (promotions, widgets, analytics) built on CQRS, event-driven .NET microservices (Dapr, multi-tenant Cosmos DB) on Azure. Engaged through to production launch: I delivered core backend features, raised the platform's production readiness, led the team's shift to guarded AI-assisted development, and cut non-production cloud costs by more than half.

Senior Software Engineer, Qiagen (May 2019 – Present)

TECH STACK

.NET Framework

.NET Core

C#

Python

DevExpress

PostgreSQL

SQLite

Elasticsearch

AWS

CI/CD

ETL

Unit Testing

RESPONSIBILITIES

Legacy System Modernization

- ▶ Owned and extended the single-cell data analysis framework, designing storage infrastructure and visualization components for large-scale genomic datasets
- ▶ Drove integration of bioinformatics tools into cloud-based pipelines and led the restructuring of AWS components
- ▶ Established the project's first unit testing and CI pipeline infrastructure; managed monitoring across cloud and on-premise deployments

Greenfield Projects

- ▶ Drove technical direction for two new products, including an MVP that evolved into a full solution, while migrating core functionalities from a legacy monolith
- ▶ Designed Elasticsearch-based data interrogation and ETL pipelines for large-scale data migration and transformation
- ▶ Implemented caching mechanisms to improve performance and ensured accurate content version tracking
- ▶ Coordinated across development, QA, and product teams – leading requirement gathering, translating business needs into technical design, and facilitating Scrum ceremonies

OVERVIEW

Qiagen has been a cornerstone in helping me see how software systems can enable efficient understanding of massive data from numerous sources, leveraging new insights in molecular diagnosis and drug discovery fields. My contribution to Omicsoft, a complete cloud-enabled NGS analytics product, has been as an engineering member, while also an active liaison between the processing, development, and QA teams.

As a senior software engineer, I worked on expanding the existing framework for single cell data analysis, developing customized storage infrastructure, improving the efficiency of processing solutions, and implementing graphical components to visualize large volumes of data. I also contributed to integrating numerous bioinformatics tools into cloud-based analysis pipelines and restructuring parts of the AWS integration.

I had the chance to lay the groundwork for unit testing, automated integration pipelines, CI pipelines, and to restructure and monitor the AWS development infrastructure. My experience spans cloud, on-premise, and SaaS deployments, in both Windows and Linux environments.

Building on this experience, I had the opportunity to design and deliver two greenfield projects, including an MVP that evolved into a full solution, while transitioning core functionalities from a legacy monolith system. I set up Elasticsearch-based data interrogation, designed ETL pipelines for migrating and transforming data, and implemented caching mechanisms to improve performance.

Working at Qiagen gave me the opportunity to grow my skills in requirement gathering, feature analysis across multidisciplinary teams, architecture and scalability design, system integration, complex solution development, and deployment on multiple operating systems – and, most importantly, to collaborate with a wide variety of talented professionals.

.NET Software Developer and Co-founder, RiseTech (Sep 2017 – May 2019)

TECH STACK

ASP.NET MVC

Honeywell Mobility Edge Android

SQL Server

NUnit

Moq

RESPONSIBILITIES

- ▶ Primarily focused on technical processes while also actively engaging with clients to provide business analysis, solution design, and support for their digital solutions
- ▶ Developed and oversaw the architecture of RaBit, a product aimed at small and medium-sized companies to facilitate objective-focused management. Managed project delivery and quality control while contributing to technical and UI/UX vision
- ▶ Other projects included developing a custom ERP warehouse management tool using Asp.Net Web API and Android mobile solutions, as well as an online consulting platform

Software Developer, Pitech+Plus (Apr 2015 – Jul 2017)

TECH STACK

ASP.NET MVC

ASP.NET Core Web API

Xamarin

Xamarin.Forms

Xamarin.Android

SQL Server

NUnit

Moq

.NET

RESPONSIBILITIES

- ▶ Managed and supported various .NET projects (ASP.NET MVC, ASP.NET/CORE WEBAPI, and Xamarin)
- ▶ Designed and maintained SQL Server databases
- ▶ Developed front-end and back-end features, analyzed code, and performed unit testing using NUnit and Moq
- ▶ Documented applications and conducted Xamarin-Forms and Xamarin-Android workshops

EDUCATION

Master of Software Engineering

2016 - 2019

Babeş-Bolyai University, Cluj-Napoca

On-campus

Thesis: Applied AI/ML to noisy, highly imbalanced biological sequences for transcription factor binding prediction, designing robust hard-negative sets and context-aware deep learning models.

Bachelor of Computer Science

2012 - 2015

Babeş-Bolyai University, Cluj-Napoca

On-campus

Thesis: Developed an augmented reality motorcycle helmet system with a companion Android app, providing real-time navigation, alerts, and contextual data to enhance rider safety and situational awareness.

COURSES

Biology track: MIT Introduction to Biology · Genome Sequencing (Bioinformatics II) · Finding Hidden Messages in DNA · ML master's thesis on transcription-factor binding

[Introduction to Biology](#) · MIT (via edX), Nov 2019

[Learn Data Analysis with Pandas](#) · Codecademy, Jan 2023

[Neural Networks and Deep Learning](#) · Coursera (DeepLearning.AI), Jun 2021

[Genome Sequencing \(Bioinformatics II\)](#) · Coursera (UC San Diego), Aug 2020

[Finding Hidden Messages in DNA](#) · Coursera (UC San Diego), Jul 2019

[Biology Meets Programming](#) · Coursera, Apr 2019

PERSONAL PORTFOLIO

[Stack Overflow RAG Assistant](#)

Personal Projects | AI & RAG

A lightweight .NET 8 RAG service that transforms Stack Overflow data into a grounded Q&A assistant with streaming answers, citations and tag suggestions

[AI Budgeting Coach](#)

Personal Projects | Web & AI

A full-stack React + TypeScript personal finance app with a .NET 8 microservices backend (PostgreSQL, RabbitMQ) using AI to auto-categorize transactions, track budgets, and provide real-time financial insights.

[Parenting Milestones](#)

Family Projects | Web & Mobile

A React-based parenting app delivering AI-curated, research-backed tips and insights for parents.
